	TITLE JOURNAL COMMENT	REFERENCE AUTHORS TITLE JOURNAL REFERENCE AUTHORS
Center: Whitelead Institute/ MIT Center for Genome Research Center code: WIBK Web Site: http://www-seq.wi.mit.edu Contact: sequence_submissions/genome.wi.mit.edu Center project name: 14108 Center clone name: 22_F_10 **NOTE: This record contains 76 individual sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone will be sequenced to completion. In the event that the record is updated, the accession number will be preserved. 755 1539 contig of 754 bp in length gap of unknown length 1040 2284 contig of 755 bp in length gap of unknown length 2841 contig of 794 bp in length gap of unknown length 4640 5394 contig of 794 bp in length gap of unknown length 5158 6908 contig of 755 bp in length gap of unknown length 6158 6908 contig of 755 bp in length gap of unknown length 6158 6908 contig of 755 bp in length gap of unknown length 6158 6908 contig of 755 bp in length gap of unknown length 6158 6908 contig of 755 bp in length gap of unknown length 6158 6908 contig of 758 bp in length gap of unknown length 6158 6908 contig of 758 bp in length 6158 6908 contig of 759 bp in length 6159 6908 contig of 7598 bp in length 6150 6908 conti	DeArellano, K., Dewar, K., Domino, M., , FitzHugh, W., Forrest, C., Funke, R. , Gardyna, S., Grant, G., Hagos, B., He C., Johnson, R., Jones, C., Kann, L., K , Lieu, C., Locke, K., Macdonald, P., McGurk, A., McKernan, K., McLaughlin, Naylor, J., Norman, C.H., O'Connor, T, Pollara, V., Riley, R., Roy, A., San mann, N., Stojanovic, N., Subramanian, , Tirrell, A., Vassiliev, H., Vo, A., W Ye, W.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cc cells comprising recombinant vectors containing the nucleic acid comprising recombinant vectors containing the nucleic acid comprising recombinant vectors containing the nucleic acid control of the secreted comprising the polynucleotide and amino acid sequences are useful for are useful for are useful for preventing, treating or ameliorating medical conditions e.g. Cc by protein or gene therapy. Pathological conditions can be also diagnosed by determining the presence of mutations in the new polynucleotides. Cc Specific uses are described for each of the polynucleotides, based on conditions the season of the polynucleotides. Cc Specific uses are described for each of the polynucleotides, based on complete the diagnosis or treatment of cancer, neurodegenerative consorders, developmental abnormalities and foetal deficiencies, blood clisorders, tumours, leukemias, diseases of the immune system, autoimmune consorders, hepatic and renal disease, lymphomas, inflammation, allergies, constensis, prostate diseases, obesity disorders, schizophrenia, corresponding and cognitive disorders, schizophrenia, corresponding, arthritis or malignancies, diseases of testes, lung corresponding arthritis or malignancies are also useful for identifying their binding partners.

Cc geodescriptor line for gene number and clone identification).

They can also be used to identify other compounds which can modulate GDP exchange. The coding sequence can be used to produce antisense products which can inhibit oncogene expression and for use in diagnosis e.g. detecting (over)expression of GRF for typing of cancers.

The PTI-1 gene comprises a unique 5 630 bp region and a 3 truncated and mutated elongation factor-1 alpha gene. It codes for a 46 kDa protein (W03518). PTI-2 (T37412), PTI-3 (T37413) and a prostate carcinoma tumour antigen gene (T37414) were also identified. The PTI-1 gene can be used to design probes useful e-9. for detection of metastatic cancer, or to produce recombinant proteins. Antisense sequences can be used in cancer therapy. A N.clavipes major ampullate gland cDNA library was screened with probes based on peptide fragments of the purified spider silk protein (see Q14185). Positive plaques were identified and the spider silk protein 1 coding sequence was determined. See also Q14184.
          Recombinant spider silk proteins - useful for making fibres Example 3; Column 25-30; 68pp; English.

The present sequence encodes a spider silk protein from the present invention. Spider silk proteins, and peptide fragments within the proteins, can be produced and purified independently and can then be mixed and made into fibres that have higher tensile strengths and elasticity than naturally occurring fibres. The fibres can be used in mixed composites. The invention allows the two naturally occurring weightla clavipes silk proteins to be produced independently so that they can later be combined to form silk fibres of high tensile strengths.

                                                                                                                                                                           This sequence encodes two proteins which are associated with granulocytic ehrlichia (GE), W20.1 and W20.2 which have been isolated from HL60 cells infected with Ehrlichia sp. GE is an acute potentially fatal tick borne infection and the proteins described in this invention can be used in vaccines to elicit a beneficial immune response in an animal to GE. They can be used for inhibiting Ehrlichoisis in an animal The products can also be used for detection and diagnosis. Sequence 4833 BP; 1484 A; 797 C; 1114 G; 1438 T;

that protein encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against S aureus infection. The polypeptides can also be used in a kit for the immunodetection of S aureus in a sample. Saureus is implicated in numerous human diseases, including cellulitis, eyelid infections, food poisoning, osteomyelitis, skin and surgical wound infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences (and their fragments) are useful as primers or probes for isolating homologues of any of the S.aureus DNA sequences contained on the computer readable medium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            of the invention. The DNA sequences are recorded on a computer reada medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches us the S.aureus DNA sequences allows putative functions to be assigned
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 anti-S.aureus vaccines

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents cDNA encoding a human imidazoline type 1 receptor (IR1), which has 559 (full length) or 298 (breakdown product) amino acid residues. The protein is highly unique in its sequence and may represent the first in a novel family of receptor proteins. The cDC can be used to produce recombinant IR1, to screen for ligands binding IR1, to raise antibodies against IR1 or to probe for other genes encoded beginning to the contraction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     P-PSDB; W43396.
Nucleic acid encoding imidazoline receptor subtype 1 -
screening for (ant)agonist, homologous receptors, etc.
